

Patient Record #8842-BC — Clinical Update

Examined a firm mass in the left breast today. The preliminary morphological analysis of the cell nuclei from the biopsy shows some concerning irregular features. Specifically, the **radius mean** was measured at 17.99, and the **texture mean** came back at 10.38.

The overall size and boundary metrics are also elevated, with a **perimeter mean** of 122.80 and an **area mean** of 1001.00. Looking at the shape itself, we're seeing a **smoothness mean** of 0.1184 and a **compactness mean** of 0.2776.

Most notably, the contour irregularities are high; the **concavity mean** is 0.3001 and the **concave points mean** is 0.1471. Given these values, the sample shows significant architectural distortion. We need to cross-reference this with the formal pathology report as soon as it's available.

Plan: Refer to oncology and check for potential metastasis.
