

Unstructured Clinical Notes

Pt. presents following referral for evaluation of palpable mass in left breast, duration unclear (pt. reports "a few months," non-specific progression). No acute pain but notes intermittent discomfort and perceived increase in firmness.

Imaging and preliminary morphometric analysis obtained. Observations as follows:

Lesion demonstrates mean radius approx. 17.99 with relatively low texture_mean (10.38), though perimeter_mean elevated at 122.8 and corresponding area_mean notably high (1001.0). Margins appear irregular on imaging correlation.

Smoothness_mean recorded at 0.1184, suggesting moderate surface variation.

Compactness_mean elevated (0.2776) alongside significant concavity_mean (0.3001) and concave points_mean (0.1471), raising concern for invasive morphology.

Symmetry_mean measured at 0.2419, mildly asymmetric. Fractal_dimension_mean 0.07871, indicating increased structural complexity.

Error metrics show radius_se 1.095 and perimeter_se 8.589 with area_se 153.4, suggesting variability in lesion boundary definition. Texture_se relatively low (0.9053). Smoothness_se 0.006399 and compactness_se 0.04904 are both present, indicating measurable variation in surface regularity and density characteristics. Concavity_se (0.05373) and concave points_se (0.01587) remain notable. Symmetry_se 0.03003, fractal_dimension_se 0.006193.

Worst-case measurements significantly elevated: radius_worst 25.38, perimeter_worst 184.6, area_worst 2019.0. Texture_worst increased to 17.33. Smoothness_worst 0.1622.

Marked escalation in compactness_worst (0.6656), concavity_worst (0.7119), and concave points_worst (0.2654), highly suggestive of aggressive architectural distortion. Symmetry_worst 0.4601 and fractal_dimension_worst 0.1189 further support irregular growth pattern.

Overall impression: features concerning for malignancy given high concavity, compactness, and size progression between mean and worst values. Recommend urgent histopathological confirmation (core needle biopsy) and staging workup.

Pt. advised and appears anxious but cooperative. Follow-up pending pathology results.
