

Structured Clinical Notes

Patient: [Redacted]

Presentation: Palpable left breast mass, gradual onset over several months, intermittent discomfort, no acute pain.

Clinical Concern: Suspicious for malignancy pending histopathology.

Feature	Mean	Standard Error (SE)	Worst
Radius	17.99	1.095	
Texture	10.38	0.9053	17.33
Perimeter	122.8	8.589	184.6
Area	1001.0	153.4	2019.0
Smoothness	0.1184	0.006399	0.1622
Compactness	0.2776	0.04904	0.6656
Concavity	0.3001	0.05373	0.7119
Concave Points	0.1471	0.01587	0.2654
Symmetry	0.2419	0.03003	0.4601
Fractal Dimension	0.07871	0.006193	0.1189

Clinical Interpretation

Enlarged lesion with high perimeter and area values.

Elevated compactness and concavity metrics suggest irregular, potentially invasive morphology.

Significant increase from mean to worst values indicates heterogeneity and possible progression.

Surface irregularity and asymmetry further support suspicion.

Plan

Urgent core needle biopsy recommended.

Imaging correlation and staging workup to follow.

Patient informed; awaiting pathology results.
